

STUDENT PARANORMAL PROJECT

API assisted a local Brisbane high school for a Year 12 Paranormal Research project. When the students were given a choice on what to do their research project on and decided to choose paranormal phenomena, they contacted API requesting assistance to complete this project. API are always keen to share their skills and knowledge and snapped up the opportunity to assist these students and arranged to conduct two investigations which they would be fully involved in.

Location

The place of interest was a cemetery and also a private residence in Brisbane where the owners had reported strange occurrences on a number of occasions.

Findings

API conducted the investigations with participation from these students and they learnt how a proper investigation is conducted. For example, they learnt how to prove or disprove readings from the EMF and temperature gauge, how to analyse EVP recordings, video camera techniques and how to analyse digital still photography and gained valuable knowledge on what and how each piece of equipment is used.

Conclusion

The night was interesting, with a few EMF spikes and temperature fluctuations, but again nothing solid to report on. It was a valued experience to help the students with their project and our main purpose was to teach a professional logical approach to conducting an investigation. From feedback we have received from the students, their report received high marks and they have discovered a new found interest in paranormal investigating and are very keen to learn more.
